

COSMO-CLM coupled to the Community Land Model: developments, applications and future directions

Edouard Davin, Ruth Lorenz, Stefanos Mystakidis, Sonia Seneviratne
ETH Zurich, Switzerland

Motivations

- Find ways to improve model performance
 - Land surface processes are promising candidates
- Need for new model capabilities:
 - To simulate quantities of interest beyond temperature, precipitation (e.g, ecosystem variables; crop productivity)
 - To address novel scientific questions (e.g., role of vegetation feedbacks during heat waves)
 - To move toward “Regional Earth System Models”

Community Land Model

- Tile approach
- Multi layer snow
- Canopy layer
- Physiology and photosynthesis (3rd generation LSM)
- River transport (option)
- Urban module (option)
- Crop phenology and irrigation (option)
- Carbon/nitrogen cycle (option)
- Transient land use (option)
- Dynamic vegetation (option)
- Dust and BVOCs (option)

COSMO-CLM²: development stages

- 2009:
 - COSMO-CLM version 4.0 coupled to CLM3.5 (by R. Stöckli and E. Davin)
 - “subroutine coupling”
 - Evaluation: *Davin et al., Clim. Dyn. [2011]*
- 2010:
 - Upgrade to COSMO-CLM version 4.8
 - Evaluation: *Davin and Seneviratne, Biogeosciences [2012]*
- 2011/2012:
 - Switch to OASIS3 coupler (by E. Maisonnave and E. Davin)
 - Upgrade to CLM4.0 (compatible with CLM3.5/CLM4)
 - **Still not scientifically evaluated!**

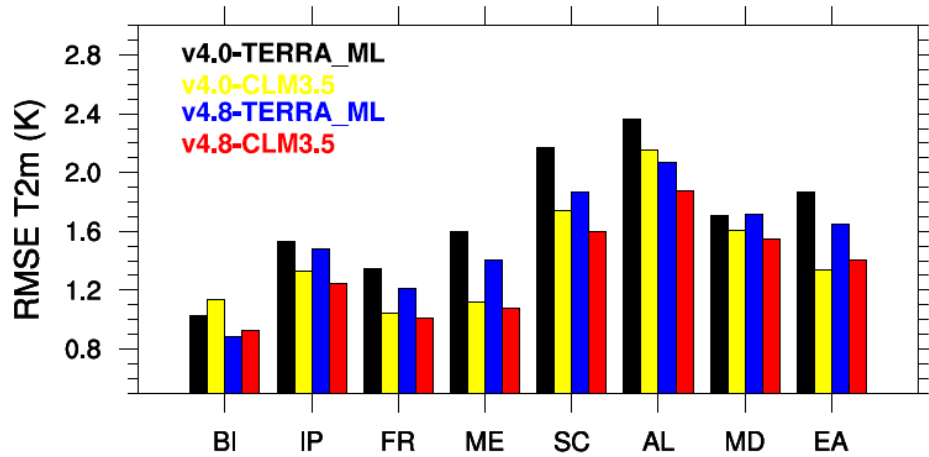

Methodology

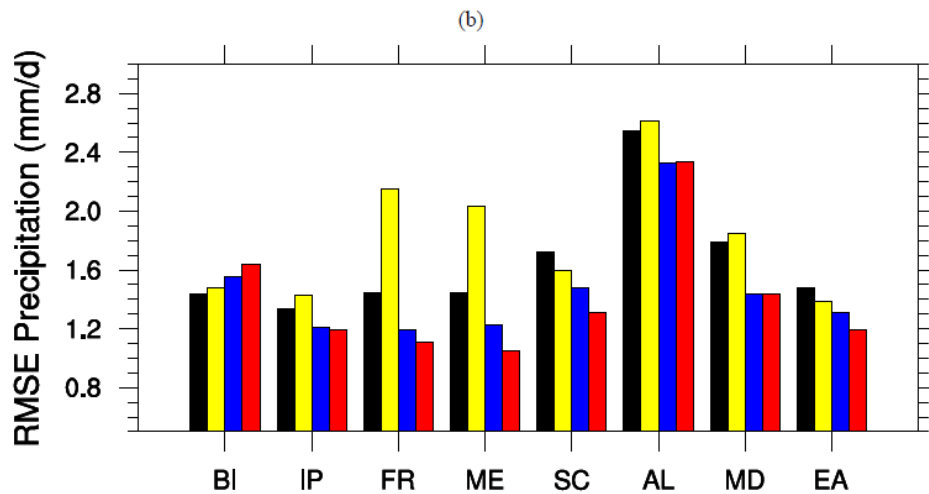

- COSMO4.8-CLM11 with “subroutine” coupling to CLM3.5
- ERA40/ERAinterim boundary conditions
- 50km resolution

- Statistics based on 20 years (or more)
- Evaluation against E-OBS (T, P) and FLUXNET (surface fluxes)

Importance of land vs atmospheric model

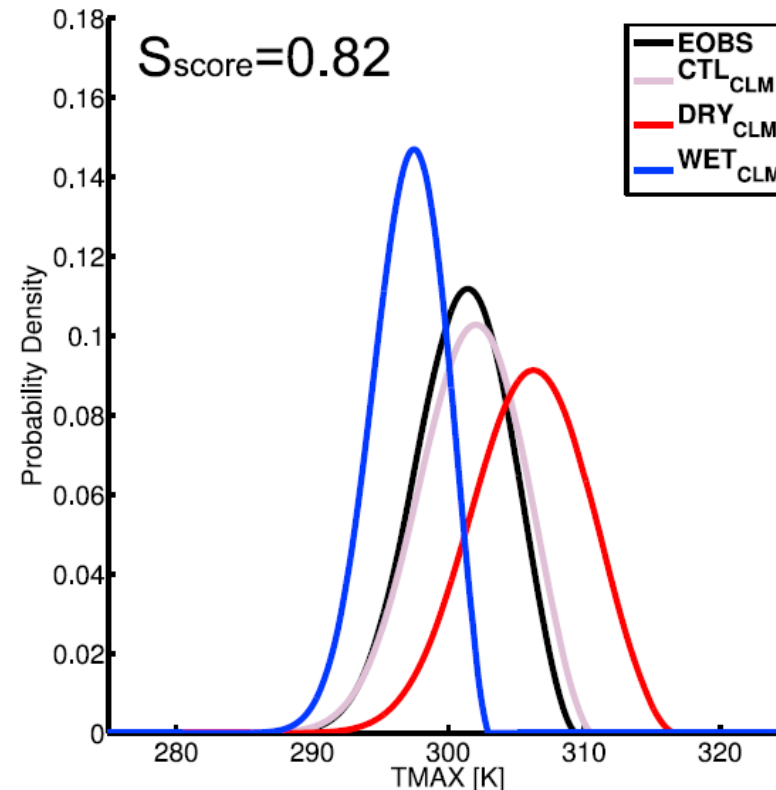

➤ Land model plays an important part in overall model performance

Davin and Seneviratne, Biogeosciences [2012]

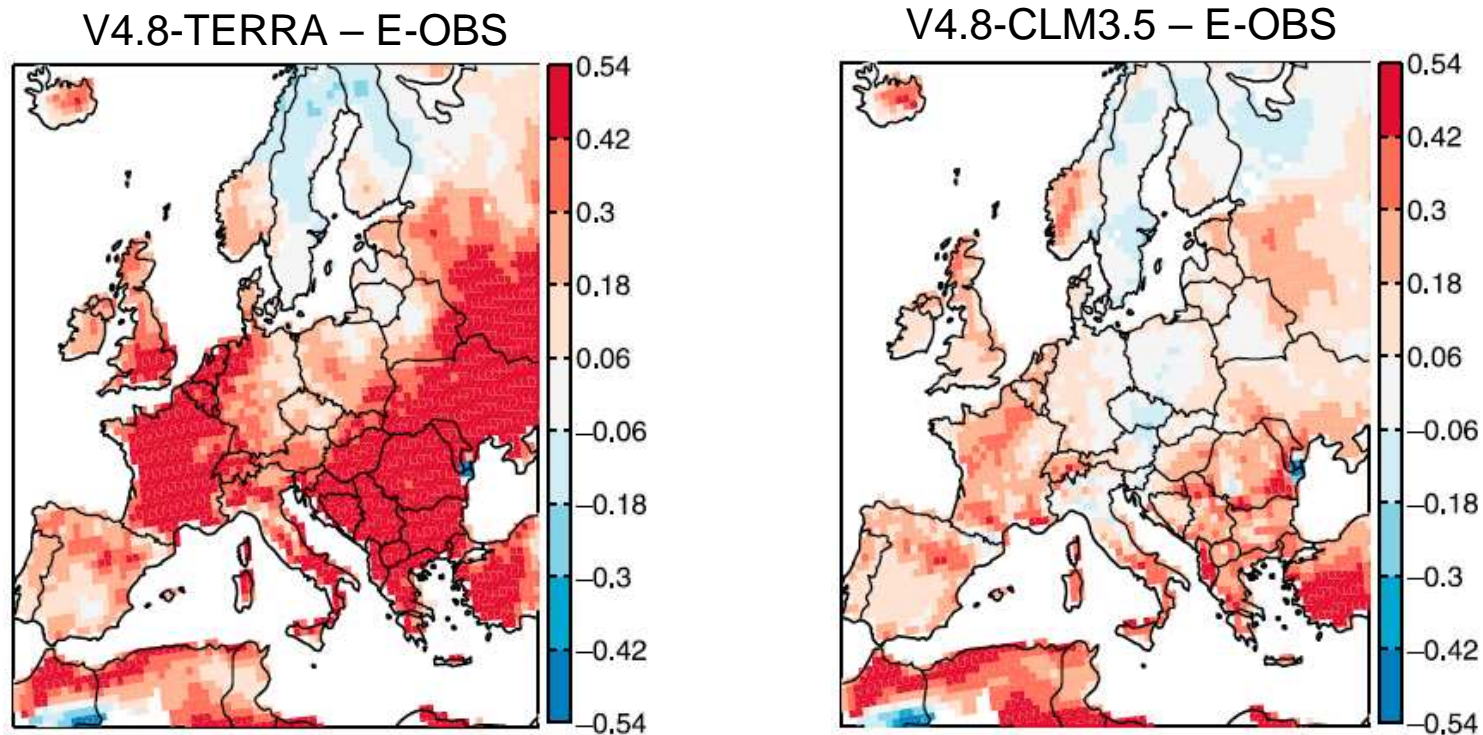

Daily statistics: summer T_{max}; Iberian peninsula

- Warm extremes are too extreme in Mediterranean regions → less pronounced with CLM3.5

Lorenz et al., JGR [2012]

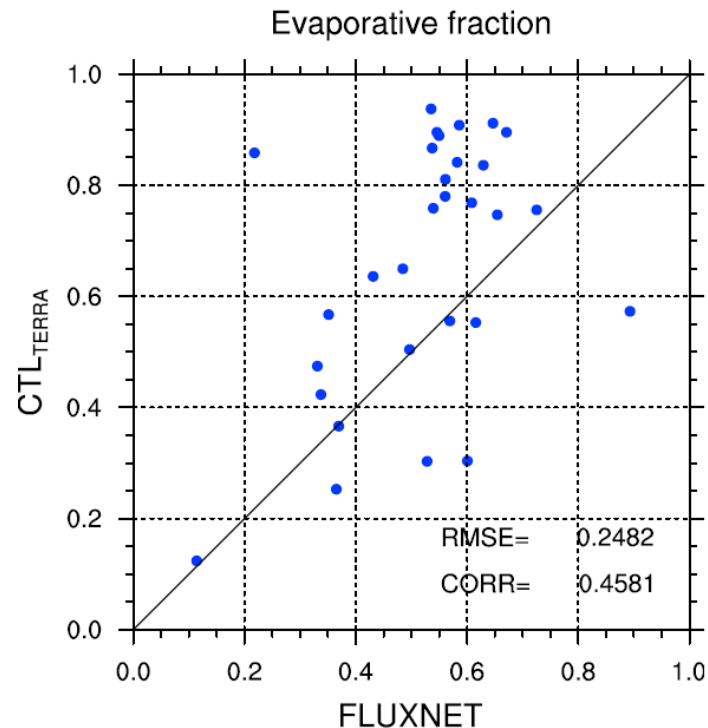

Interannual summer variability T2m

- Overestimation of interannual summer variability common feature in many RCMs [see e.g., Jacob et al., 2007]
- Partly alleviated when using CLM3.5

Lorenz et al., JGR [2012]

Evaporative fraction against FLUXNET

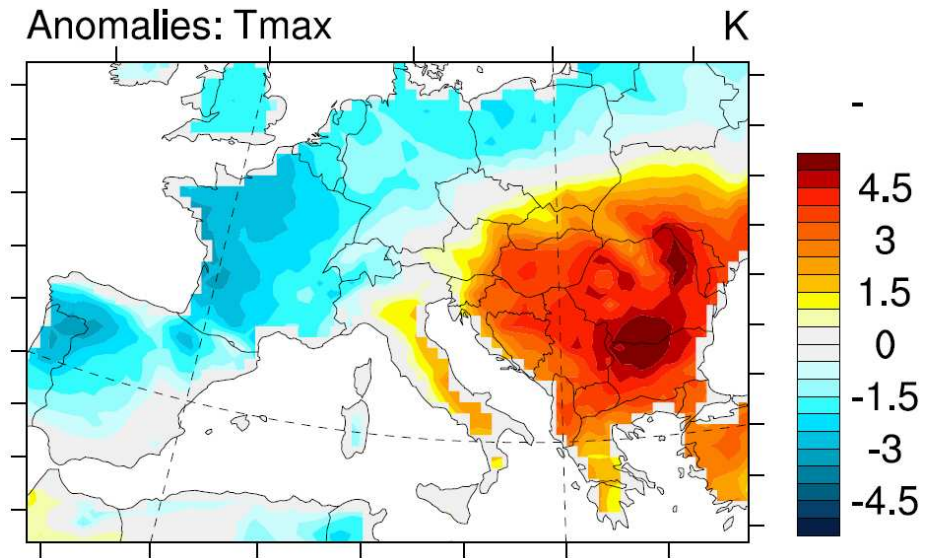

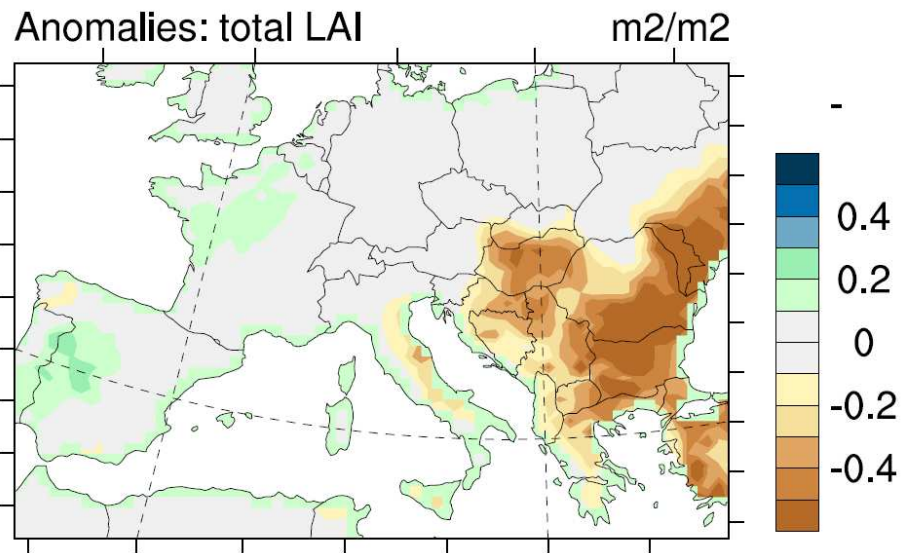

- Too high Evaporative fraction with TERRA alleviated with CLM3.5
- Too low SWnet (due to cloud cover overestimation) alleviated with CLM3.5 [Davin et al, Clim. Dyn. 2011]

Lorenz et al., JGR [2012]

Current applications

- Effect of diffuse/direct radiation partitioning on plant transpiration
- Impact of Amazonian deforestation
- Impact of agricultural management on regional climate
- **Role of vegetation feedbacks during heat waves**
- **Regional climate-carbon cycle feedbacks**

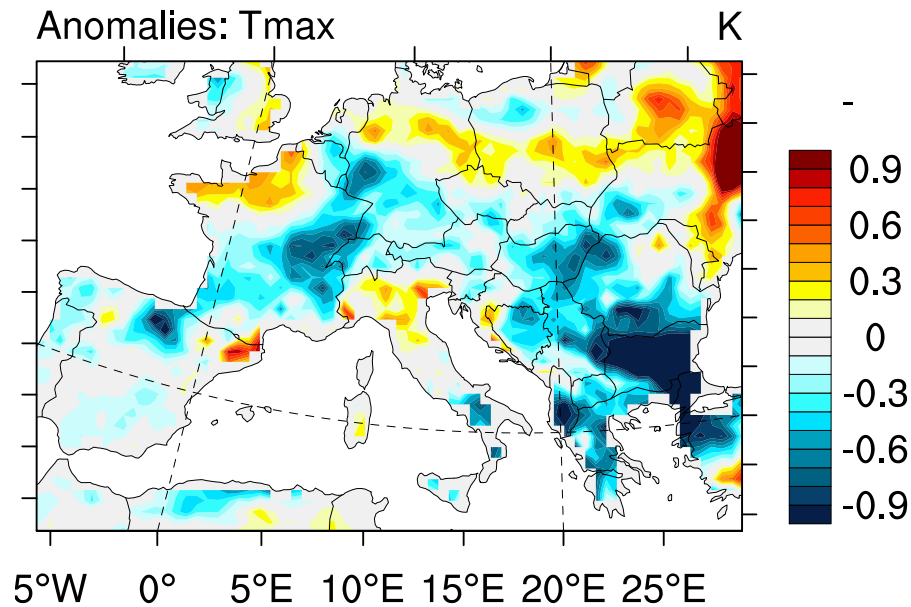

2007 heat wave: Role of phenology vs soil moisture

Coupling with Carbon-Nitrogen cycles

Upscaled FLUXNET

CLM4.0

Annual GPP (gC/m²/yr)

PhD S. Mystakidis

Coupling with OASIS3(-MCT)

- Well established and supported coupler
- More flexibility (use of different grids, time stepping)
- Interface compatible with CLM4.0/CLM3.5
- Potential for better performance optimization
- Unified interface for land, ocean, 2-way nesting → cf OASIS Project Group

- Remaining technical issues: e.g. problem with restarts

Conclusions

- Land surface model development is a promising avenue for improving overall model performance
- Marked influence on temperature extremes
- Opportunities to explore novel research questions

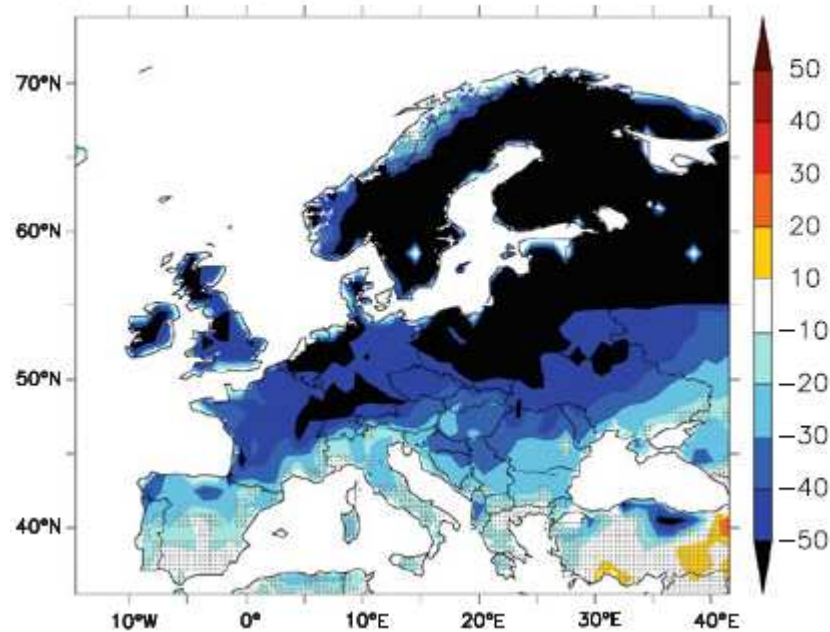

Conclusions

- Land surface model development is a promising avenue for improving overall model performance
- Marked influence on temperature extremes
- Opportunities to explore novel research questions

Thank you for your attention!

Comparison CLM3.5 vs TERRA

(c) SWnet (W/m^2); COSMO-CLM – GSWP-2

(d) SWnet (W/m^2); COSMO-CLM² – GSWP-2

- Due to a reduced positive bias in cloud cover

Davin et al., Clim. Dyn. [2011]

Biological dimension of land-atmosphere exchanges

- Transpiration: half of the water flux from the land to the atmosphere globally
- Evapotranspiration is biologically regulated

(Dirmeyer et al., 2006)

Adapted from N. Viovy

Climate models have improved

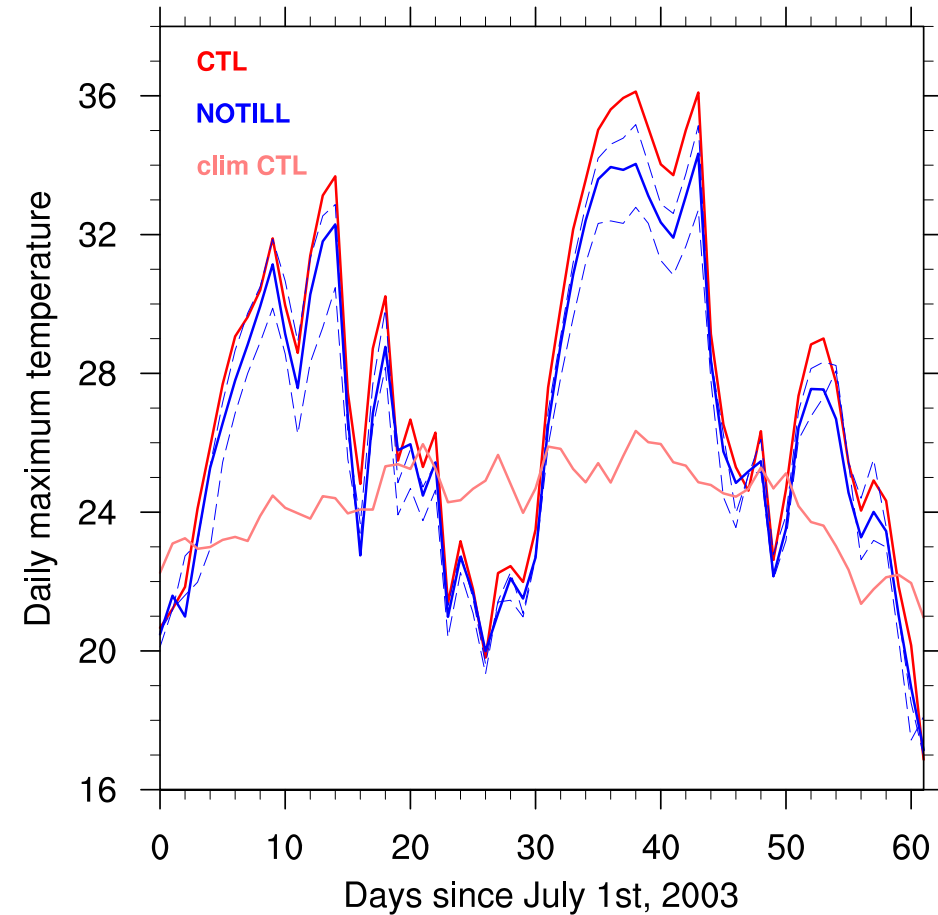

Reichler and Kim, BAMS, 2008

No-till farming and heat waves

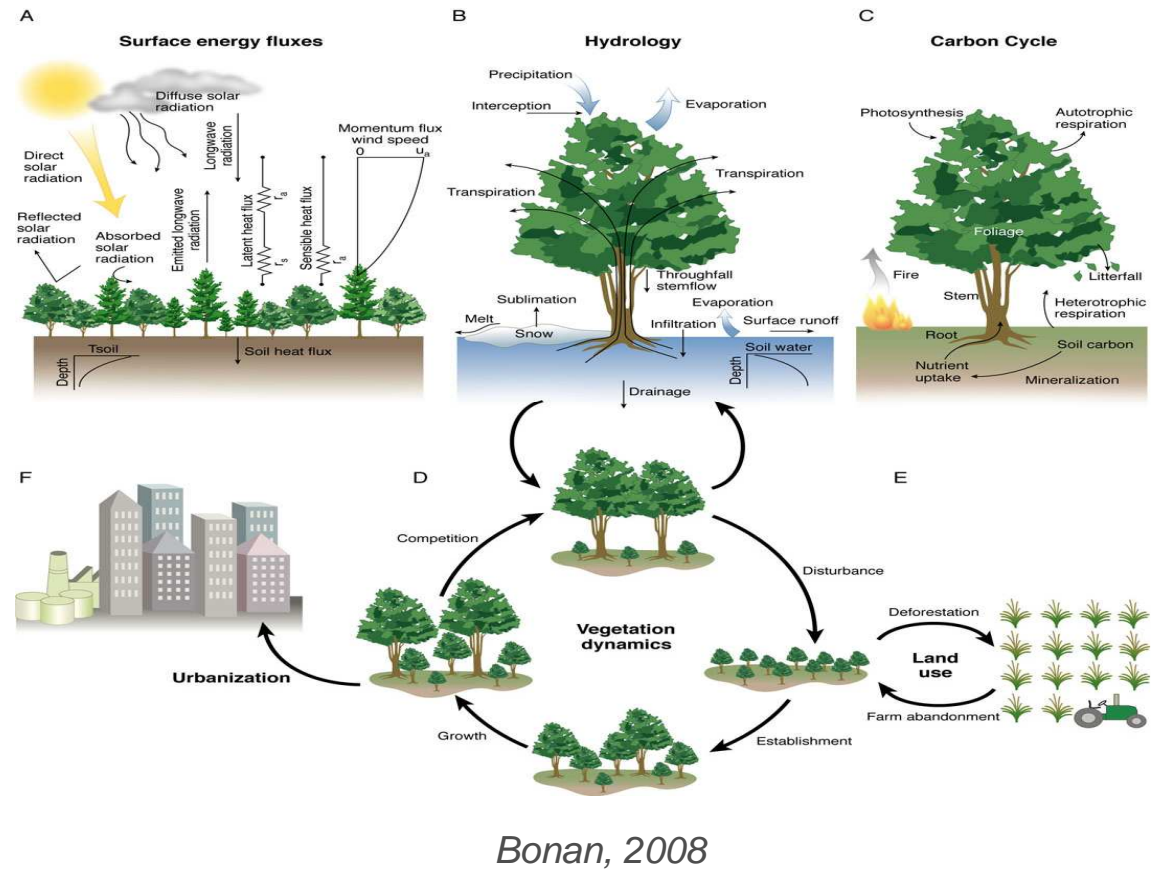

- Climate mitigation potential (cooling effect) of no-till farming particularly strong during heat waves

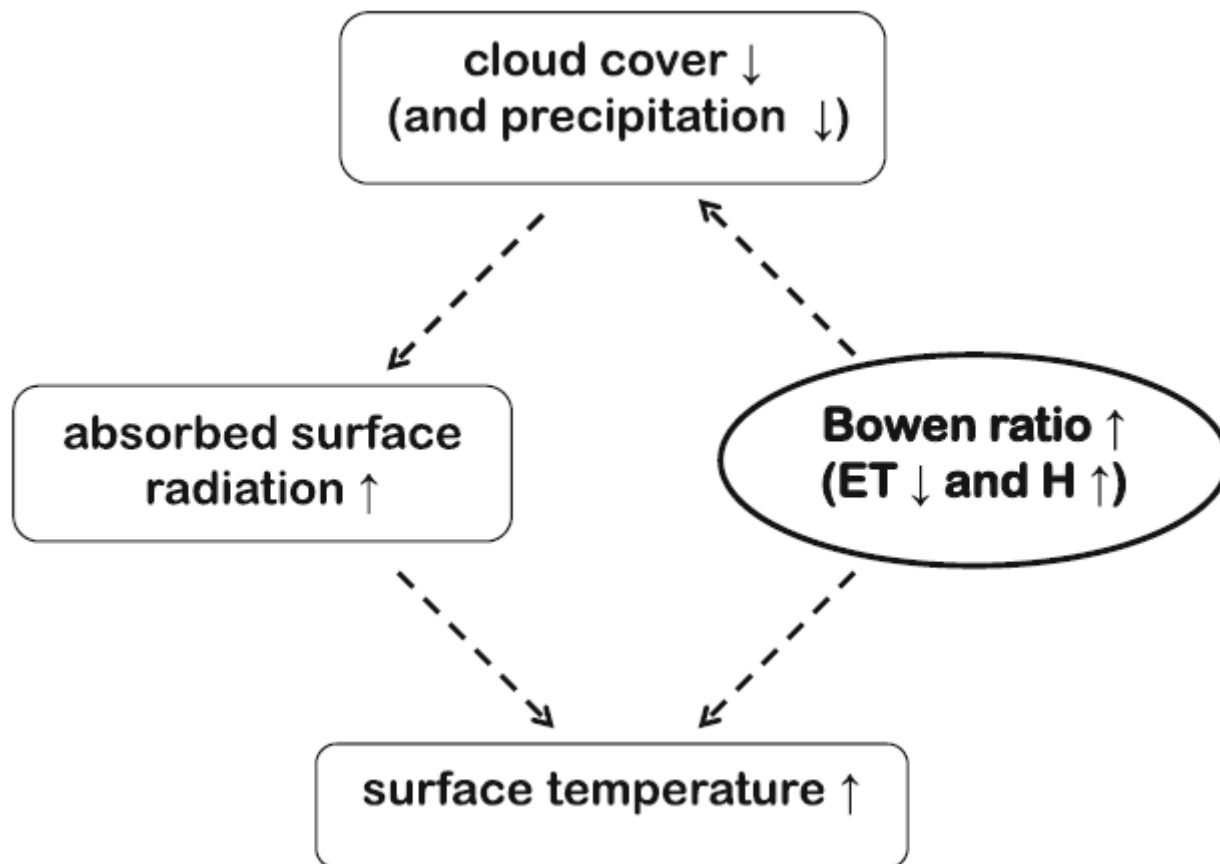

Community Land Model

- Open source
- Extensively documented and evaluated
- Comprehensive range of processes through a modular code structure
- Current version: CLM4, preceding version: CLM3.5

Overview of mechanism

Davin et al., Clim. Dyn. [2011]

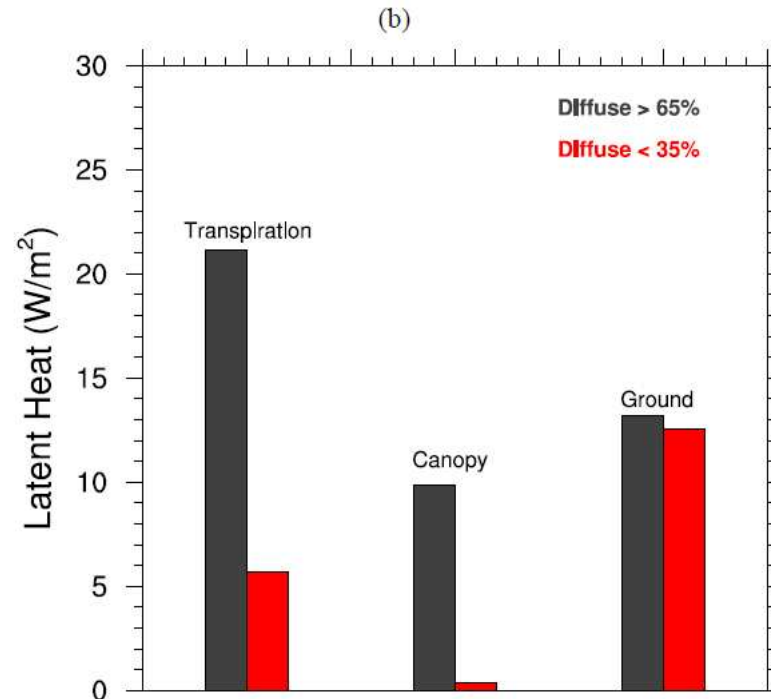

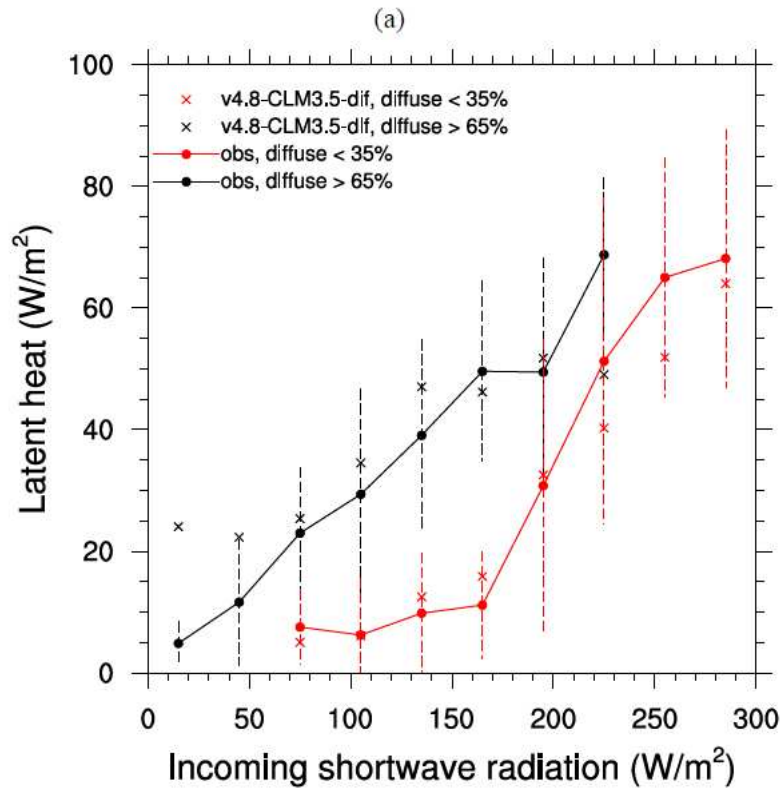

Impact on model performance

- Slight improvement in model skill when taking into account diffuse/direct partitioning
- Modest role compared to the overall effect of changing the LSM

Davin and Seneviratne, Biogeoscience [2012]

Role of diffuse radiation

Davin and Seneviratne, Biogeosciences [2012]
