COSMO/CLM User seminar

March 2013

Outline

- 1 Introduction and motivation
- 2 Method
- 3 Evaluation
- 4 Conclusion

Clouds in climate model

GCM (100 km)

RCM (25 km)

- ▶ GCM & RCM: Parametrization of convective clouds
 - ▶ Underestimation of diurnal temperature range, overestimation of clouds, summer convective precipitation poorly represented (e.g. Dai and Trenberth, 2004; Brockhaus et al., 2008)

(Figures: E. Zubler)

Clouds in climate model

GCM (100 km)

RCM (25 km)

CRM (1 km)

- ▶ GCM & RCM: Parametrization of convective clouds
 - ▶ Underestimation of diurnal temperature range, overestimation of clouds, summer convective precipitation poorly represented (e.g. Dai and Trenberth, 2004; Brockhaus et al., 2008)
- ▶ CRM: Convection explicitly resolved

(Figures: E. Zubler)

Cloud-resolving modelling

Experience with NWP → CRM leads to better forecast (e.g. Mass et al., 2002; Richard et al., 2007)

Cloud-resolving modelling

Experience with NWP → CRM leads to better forecast (e.g. Mass et al., 2002; Richard et al., 2007)

Climate time scale

- ▶ Process studies
 - ▶ CRM reproduces a better timing of convective diurnal cycle (e.g. Hohenegger et al., 2008)
 - ▶ Physical and numerical convergence of CRM (Langhans et al., 2012)
 - ▶ CRM yields negative soil-moisture precipitation feedback (Hohenegger et al., 2009)
- ▶ Application to long-term scenario simulations has been very limited

Today

- ▶ CRM simulation for the greater Alpine region
 - ▶ 10 year long period: 1998-2007
 - ▶ driven by ERA-Interim reanalysis

Today

- ▶ CRM simulation for the greater Alpine region
 - ▶ 10 year long period: 1998-2007
 - ▶ driven by ERA-Interim reanalysis
 - ▶ Cost: 2×10^6 CPUh (approx. 6 months wallclock time)

Today

- ▶ CRM simulation for the greater Alpine region
 - ▶ 10 year long period: 1998-2007
 - ▶ driven by ERA-Interim reanalysis
 - ▶ Cost: 2×10^6 CPUh (approx. 6 months wallclock time)

Objectives

- ▶ To evaluate the CRM climate simulation against observational datasets and to compare it against coarser climate simulation
- ▶ Does the CRM model improve the representation of geographical distribution of precipitation climatology and precipitation statistics (daily/hourly statistics)?
- ▶ To investigate whether and how the scaling of precipitation extremes with temperature in CRM model follows the expectations from the Clausius-Clapeyron relation

Setup

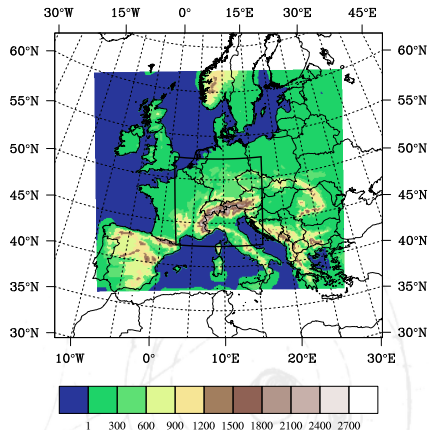

Two step one way nesting: ERA-Interim \Rightarrow CPM \Rightarrow CRM

▶ CPM

- ▶ 12 km (0.11°)

▶ CRM

- ▶ 2.2 km (0.02°)

Setup

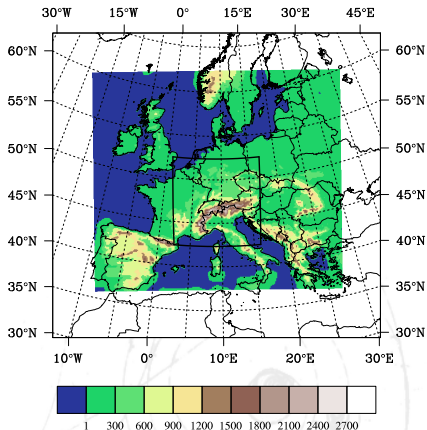

Two step one way nesting: ERA-Interim \Rightarrow CPM \Rightarrow CRM

▶ CPM

- ▶ 12 km (0.11°)
- ▶ Parametrization of convection: Tiedtke
- ▶ Spin-up: 5 years

▶ CRM

- ▶ 2.2 km (0.02°)
- ▶ Convection explicitly resolved
- ▶ Shallow convection: Tiedtke
- ▶ Spin-up: 2 months

Setup

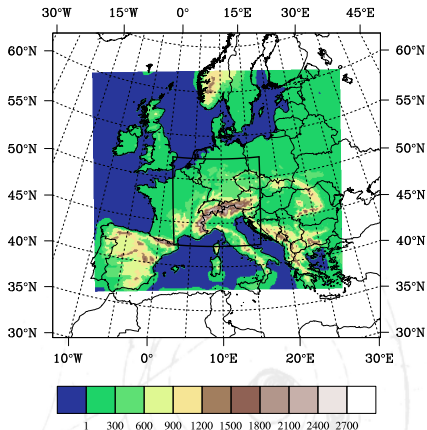

Two step one way nesting: ERA-Interim \Rightarrow CPM \Rightarrow CRM

▶ CPM

- ▶ 12 km (0.11°)
- ▶ Parametrization of convection: Tiedtke
- ▶ Spin-up: 5 years

▶ CRM

- ▶ 2.2 km (0.02°)
- ▶ Convection explicitly resolved
- ▶ Shallow convection: Tiedtke
- ▶ Spin-up: 2 months

Model

COSMO-CLM 4.14

Observations

EOBS

- ▶ Gridded dataset, horizontal resolution 0.25°
- ▶ Temperature (version 7.0), Precipitation (version 5.0)

CH (Meteoswiss)

- ▶ High resolution (0.01°) gridded precipitation dataset, available over Switzerland
- ▶ Based on radar and raingauge data, not corrected for gauge undercatch
- ▶ Daily precipitation (1998-2006), Hourly precipitation (2004-2007)

ANETZ

- ▶ 24 Swiss station, 1998-2007
- ▶ T2M, SW↓, Precipitation

★ T2M → Simple height correction applied ($0.65 \text{ K}/100\text{m}$)

Evaluation

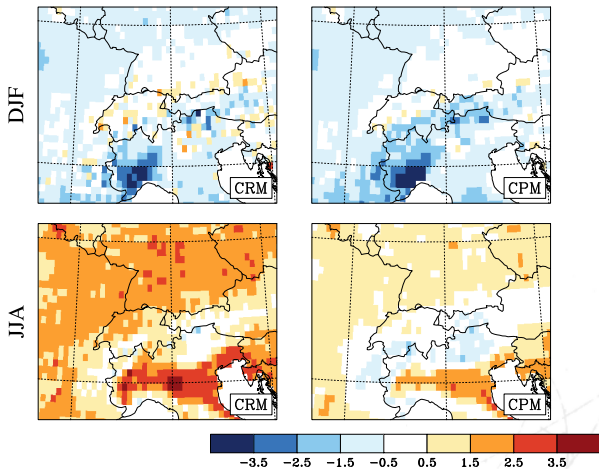

Evaluation

T2M, SEB

Temperature

Model vs EOBS

Temperature

Model vs EOBS

CRM vs CPM

Diurnal cycle of temperature

Perturbation of a daily temperature:

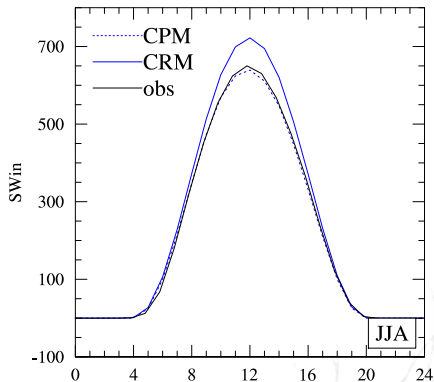

$$T' = T(\tau) - \bar{T}$$

[Analysis for 24 Swiss station]

- ▶ T' better presented by CRM

Diurnal cycle of SW_{\downarrow}

[Analysis for 24 Swiss stations]

- ▶ JJA → CRM overestimates SW_{\downarrow} by up to $100 W m^{-2}$

Surface energy budget

Surface energy budget: $Q = R_n + SHF + LHF + GHF$

Net radiation: $R_n = SHF + LHF + GHF$

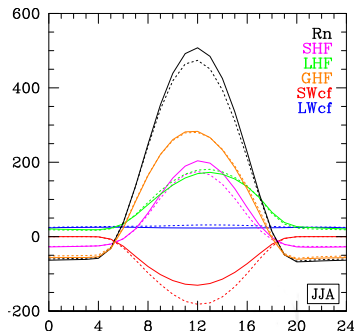

[CRM-solid lines, CPM-dashed lines]

- ▶ JJA → CRM: $SHF > LHF$ → dry soil

Surface energy budget

Shortwave cloud forcing: $SWcf = SWn - SWn(\text{clear sky})$

Longwave cloud forcing: $LWcf = LWn - LWn(\text{clear sky})$

[CRM-solid lines, CPM-dashed lines]

- ▶ $SWcf(\text{CPM}) < SWcf(\text{CRM}) \rightarrow$ less clouds in CRM \rightarrow more $SW\downarrow \rightarrow$ higher temperature

Reduced cloud cover (CRM vs. CPM)

- ★ Modified PBL scheme in CRM, graupel scheme
- ★ Validation of clouds against observations is underway (Michael Keller)
- ★ Langhans et al., 2012 → Both models, CPM and CRM overestimate cloud cover (over the Alps)

Evaluation

Precipitation

Mean precipitation

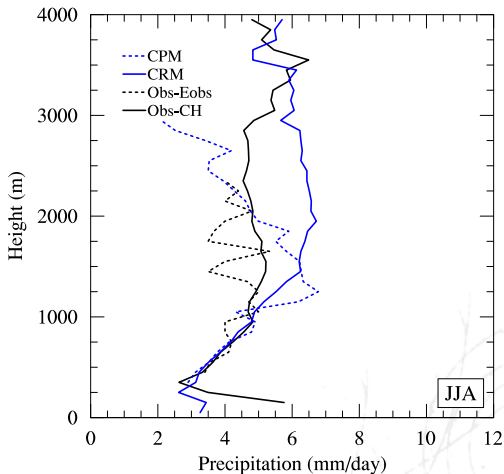

- ▶ DJF → Similar large-scale patterns for both models
- ▶ JJA → Too dry over NW part of domain and too wet over Alps for both models

Diurnal cycle of summer precipitation

- ▶ Unlike CPM, CRM gives a much better representation of diurnal cycle

Mean precipitation as a function of height

[The analysis covers only Switzerland]

Frequency distribution of precipitation (JJA)

Daily precipitation

Frequency distribution of precipitation (JJA)

Daily precipitation

Hourly maximum precipitation

[Analysis for 24 Swiss stations; W&D days (hours)-left, W days (hours)-right column]

Evaluation

The scaling of precipitation extremes with temperature

The scaling of precipitation extremes with temperature

- ★ 7% increase per °C
- ★ 14% increase per °C

[Analysis for 24 Swiss stations, JJA]

The scaling of precipitation extremes with temperature

★ 7% increase per °C

★ 14% increase per °C

[Analysis for 24 Swiss stations, JJA]

The scaling of precipitation extremes with temperature

- ★ 7% increase per °C
- ★ 14% increase per °C

[Analysis for 24 Swiss stations, JJA]

Conclusion and Outlook

- ▶ Differences in biases between CPM and CRM are comparatively small, and likely due to differences in cloud forcing
- ▶ CRM improves the simulation on sub-daily time-scale (Timing of summer convection)
- ▶ CPM has a poor diurnal cycle associated with the use of parametrized convection
- ▶ CRM captures extreme precipitation quite well, while CPM underestimate the frequency and intensity of extreme precipitation

Conclusion and Outlook

- ▶ Differences in biases between CPM and CRM are comparatively small, and likely due to differences in cloud forcing
- ▶ CRM improves the simulation on sub-daily time-scale (Timing of summer convection)
- ▶ CPM has a poor diurnal cycle associated with the use of parametrized convection
- ▶ CRM captures extreme precipitation quite well, while CPM underestimate the frequency and intensity of extreme precipitation

Outlook

- ▶ The CRM method is applied to scenario simulations

Conclusion and Outlook
