DEPARTMENT OF EARTH AND ENVIRONMENTAL SCIENCES

KU Leuven - BELGIUM

## 1. Motivation

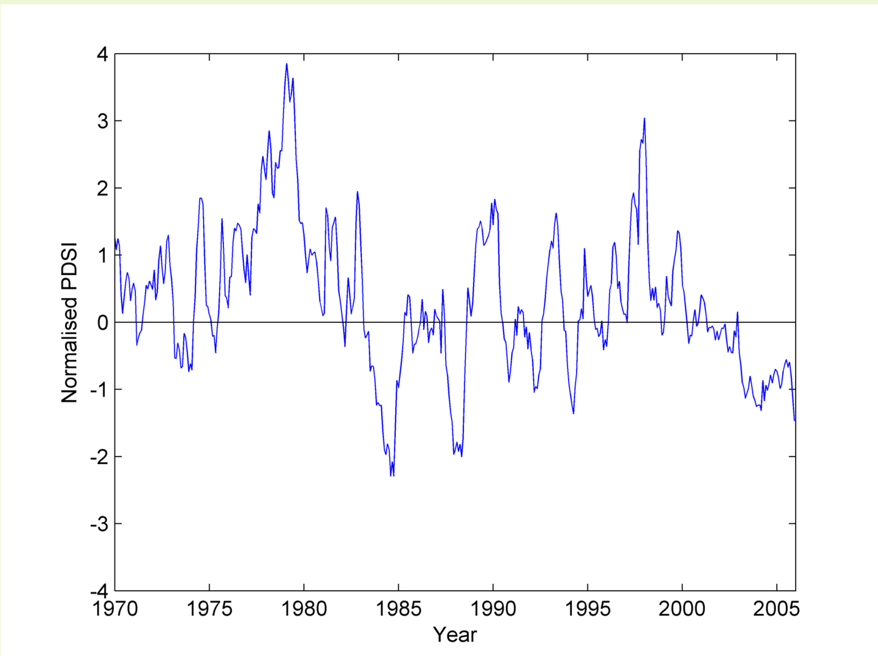

*Figure 1. Study area weighed normalised PDSI index (data: KNMI)*

- **High interannual precipitation variability poses severe risks for population and food security**

*Figure 2. Live Aid Concert 1985*

## 2. Setup

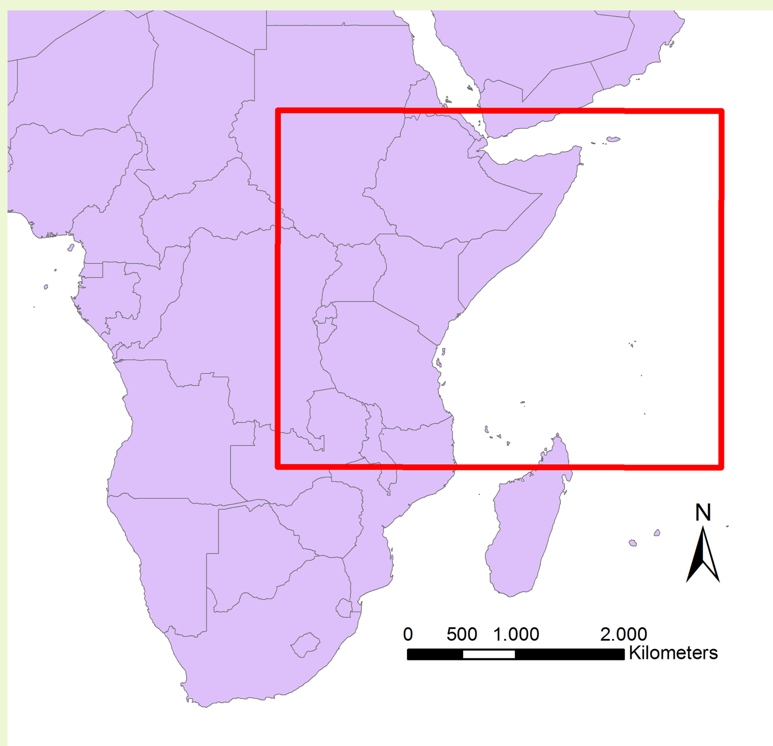

*Figure 3. Study area*

- **1981-2010**
- **ERA Interim data**
- **Relate Mean Sea Level Pressure to:**
  - **Total Precipitation**
  - **Large-Scale Precipitation**
  - **Convective Precipitation**

## 3. COST733Class

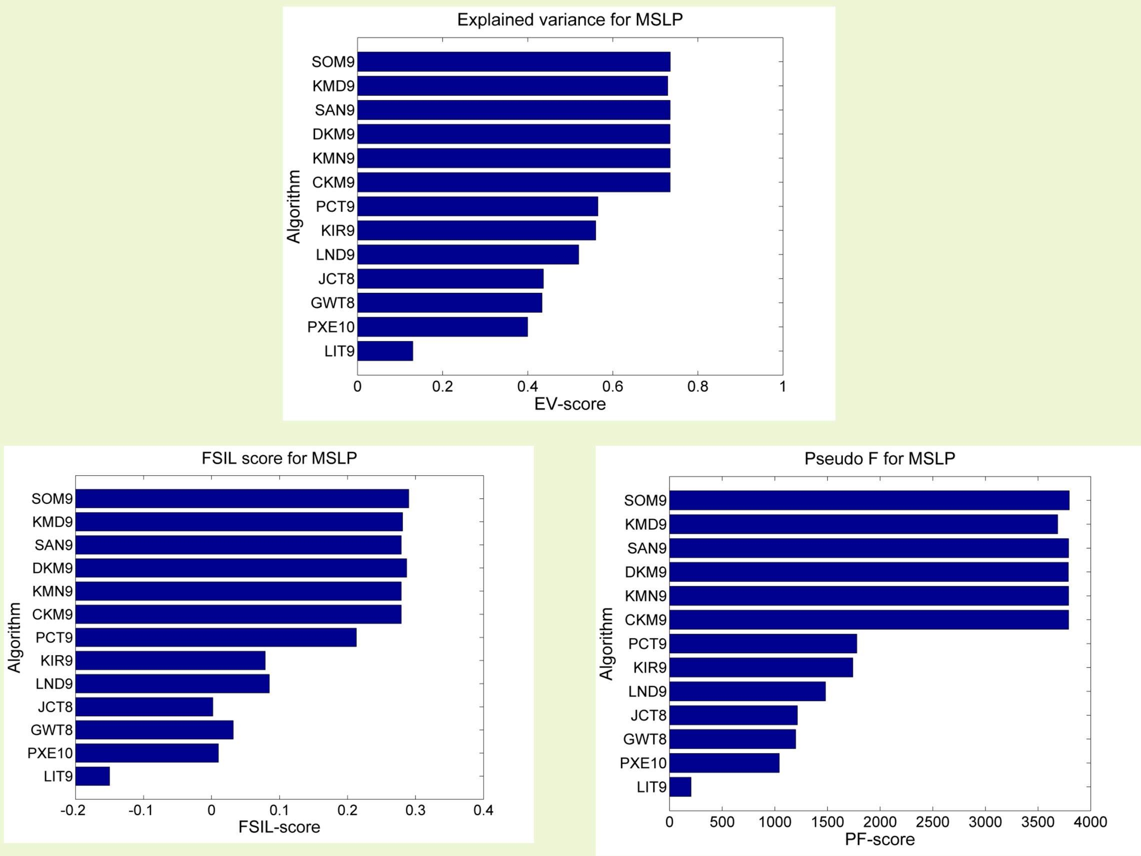

*Figure 4. Separability analysis regarding Mean Sea Level Pressure*

- **Classify Mean Sea Level Pressure in different patterns**
- **Evaluate different classification algorithms with different separability measures**
- **Separating pressure patterns is considered most important**
- **Neural-network classifications perform best in separating pressure patterns**

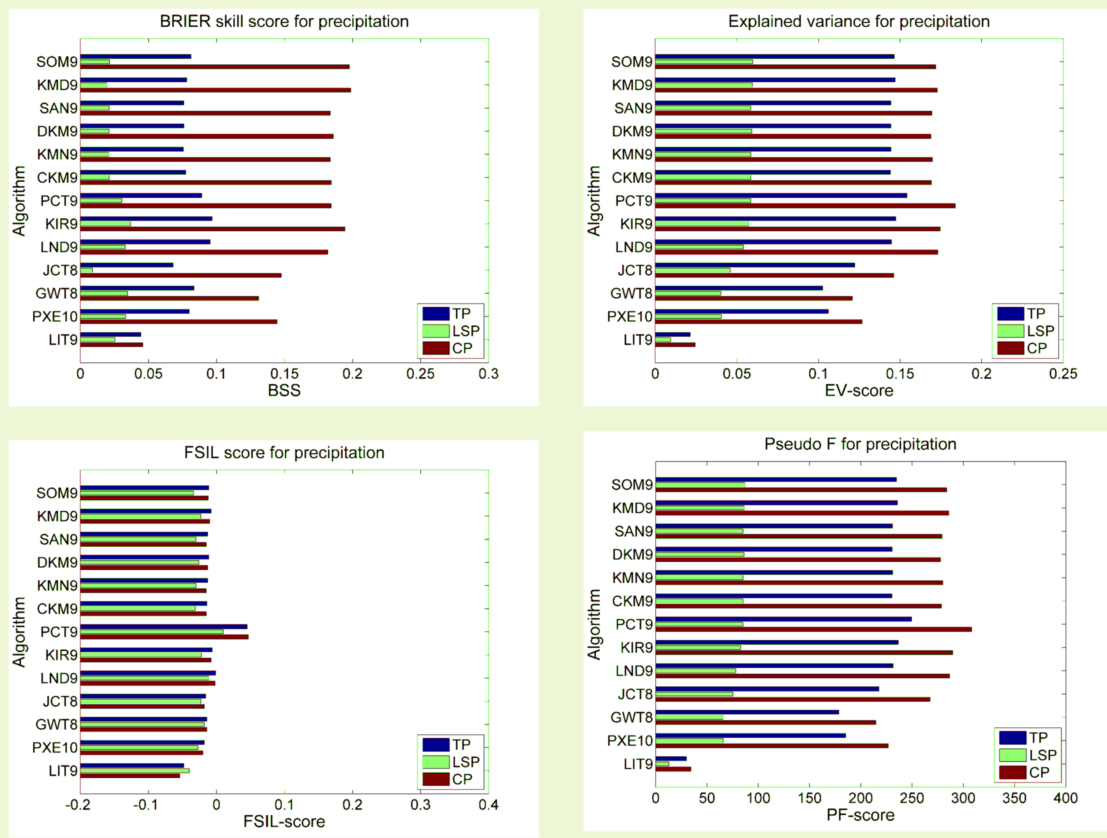

*Figure 5. Separability analysis regarding precipitation*

## 4. Weather Atlas

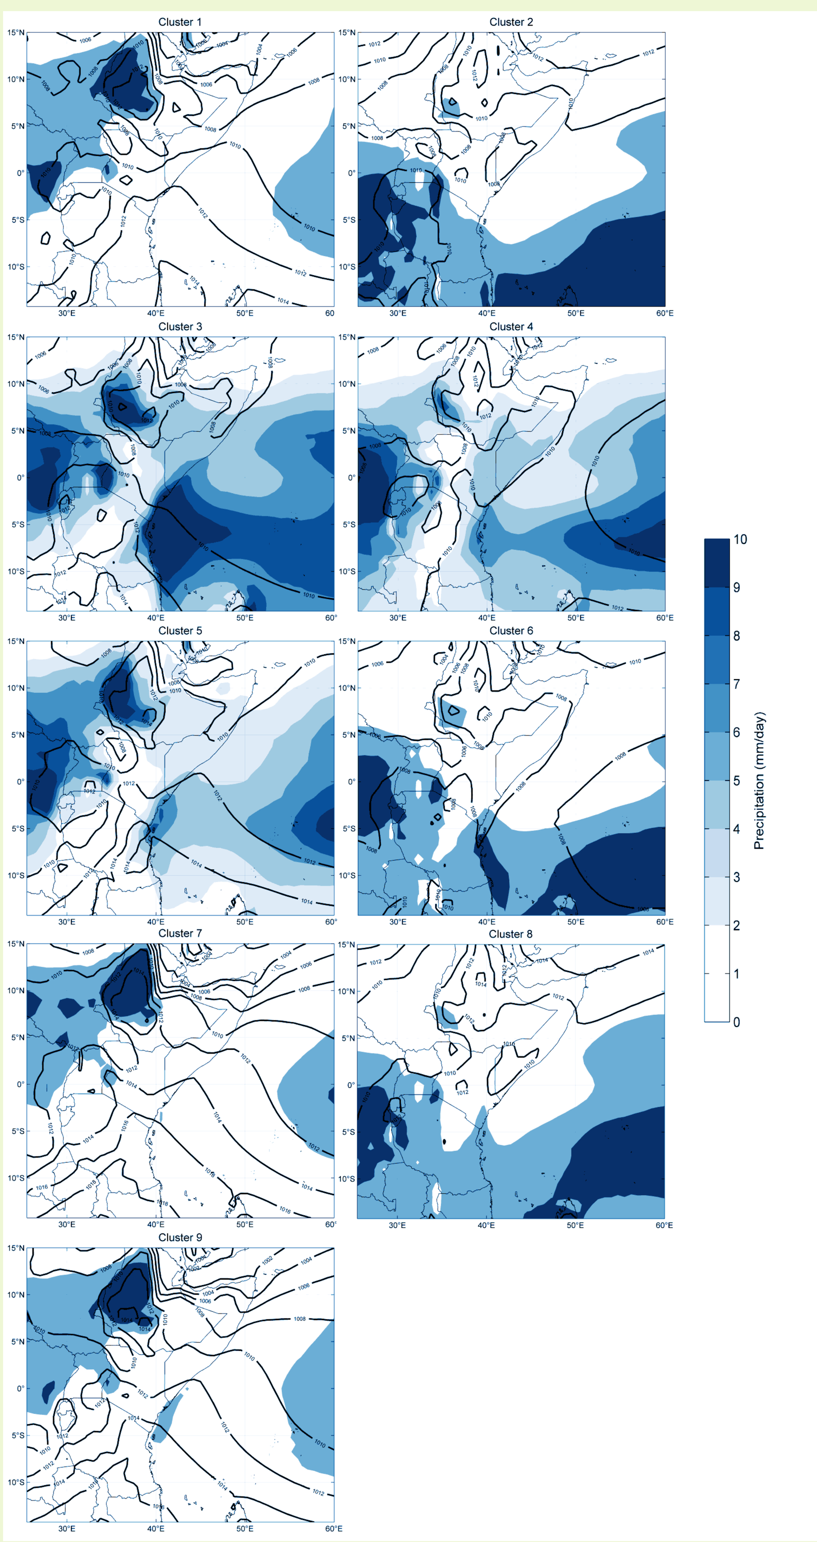

*Figure 6. Results of the best classification algorithm*

| Month | C1 | C2 | C3 | C4 | C5 | C6 | C7 | C8 | C9 |
|---|---|---|---|---|---|---|---|---|---|
| January | 0 | 45.7 | 0 | 4.6 | 0 | 8.1 | 0 | 41.6 | 0 |
| February | 0 | 42.7 | 0.1 | 9.2 | 0 | 24.3 | 0 | 23.7 | 0 |
| March | 0 | 20.6 | 5.4 | 18.2 | 0.1 | 45.5 | 0 | 10.2 | 0 |
| April | 0 | 2.6 | 52.5 | 11.2 | 2.6 | 28.8 | 0 | 2.3 | 0 |
| May | 5.4 | 0 | 52.4 | 1.0 | 14.4 | 2.8 | 3.0 | 0 | 21.0 |
| June | 7.0 | 0 | 2.2 | 0 | 0.7 | 0 | 33.4 | 0 | 56.7 |
| July | 2.5 | 0 | 0 | 0 | 0.1 | 0 | 56.8 | 0 | 40.6 |
| August | 14.7 | 0 | 0 | 0 | 4.3 | 0 | 47.2 | 0 | 33.8 |
| September | 48.6 | 0 | 0.4 | 1.4 | 32.8 | 0.1 | 7.8 | 0 | 8.9 |
| October | 9.1 | 0 | 1.7 | 49 | 35.3 | 3.3 | 0 | 1.6 | 0 |
| November | 0 | 9.4 | 0.6 | 51.4 | 3.2 | 10.3 | 0 | 25.1 | 0 |
| December | 0 | 36.4 | 0 | 13.3 | 0 | 6.3 | 0 | 44.0 | 0 |

*Figure 7. Occurrence of different circulation types per month in the period 1981-2010*

- **Distinct seasonal patterns are visible**
- **Precipitation patterns are clearly related to circulation**
- **Droughts / wet spells are mostly related to differences in interannual frequency of circulation patterns**

## 5. (Near-) future results

- **Classify pressure patterns of COSMO-CLM present (1989-2010) and future (2081-2100) simulations**
- **RCP8.5 scenario**
- **Relate changes in precipitation and PDSI (variability) to changes in circulation patterns**
- **Changes in circulation pattern frequency and the patterns itself**
- **Relate circulation pattern occurrence to El Niño / La Nina events**
- **Possible relation with dry / wet periods**
- **Clear correlation between Nino3.4 index and precipitation observations in the long rain season (October, November, December).**
- **Possible lagged relation in the short rain season (March, April, May)**

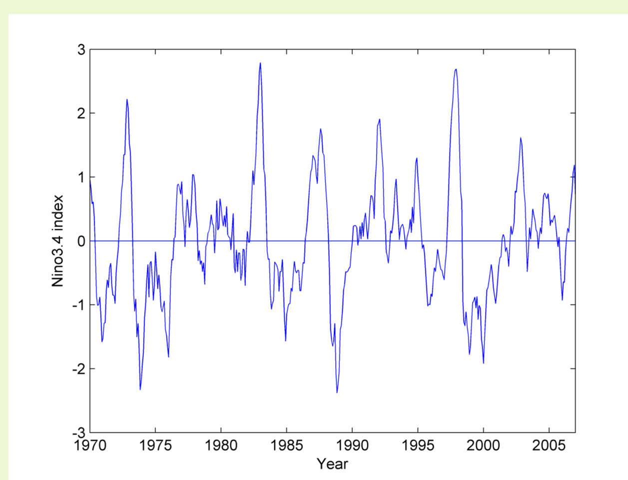

*Figure 8. Nino 3.4 index (data: KNMI)*

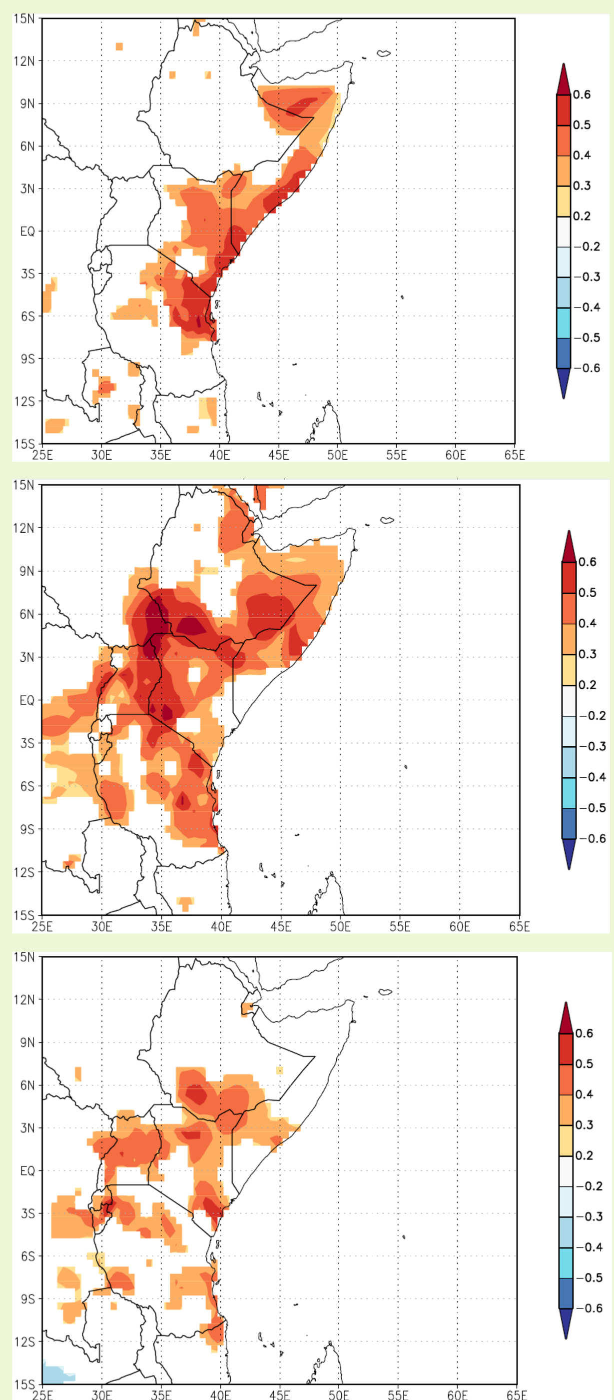

*Figure 9. Correlation between Nino 3.4 and precipitation (CRU) for Oct, Nov and Dec (data: KNMI)*
