

FOGCAST

Probabilistic fog forecasting
based on operational COSMO-DE model

Maike Hacker, Matthieu Masbou, Sabrina Bentzien

COSMO/CLM User Seminar
DWD, Offenbach/Main, 19 March 2014

Transregional Collaborative
Research Center 32

Motivation

- Fog = small scale phenomenon
- Sophisticated 3D fog models
 - + advanced microphysical parameterization schemes
 - + high vertical resolution
 - + promising results
 - CPU time beyond the range of an operational setup
- Testbed for COSMO-DE to identify which model parameterization contains skill for fog forecast
- → Find an optimal set up of COSMO-DE for operational fog forecasts

First Step: Fog Stability Index
Deterministic approach

From FSI to FOGCAST
Probabilistic approach

Conclusions and Outlook

Fog Stability Index

Fog Stability Index (Air Weather Service (1979))

$$FSI = 2 \cdot (T - T_d) + 2 \cdot (T - T_{850}) + V_{h,850}$$

Dewpoint spread

Horizontal wind speed at 850 hPa

Vertical temperature gradient

Fog risk

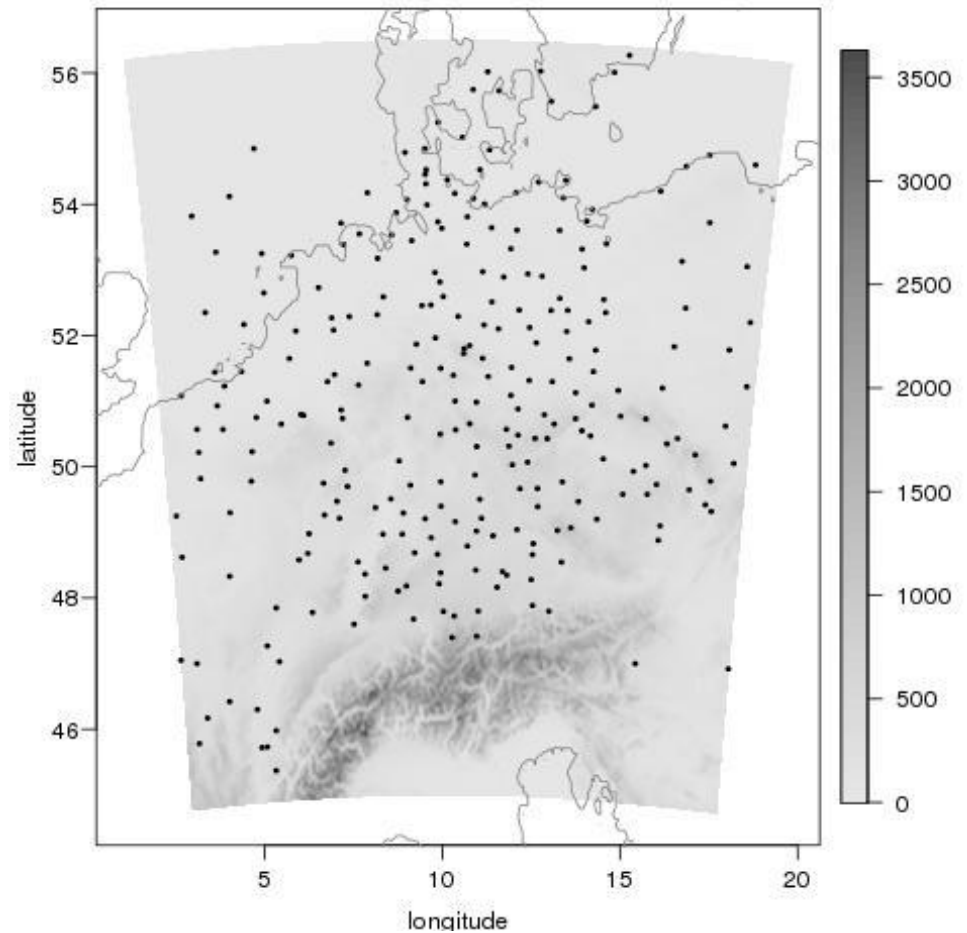

Apply FSI to COSMO-DE forecasts for 2011
(initialized at 00 UTC, 21 hours)

Data for Verification

SYNOP stations

- Hourly measurements of visibility
- 269 stations
- Fog – **Yes?** or **No?**
VIS \leq 1000 m

FSI and Visibility – November 2011

Conditional observed frequency

Scores from contingency table

Fog event over Germany

14.11.2011 12 UTC

Visible channel MSG

FOGCAST

- Learning from history data: relate observation y_i and covariates x_i

- **Generalized linear models**

- linear predictor: $\eta_i = \vec{x}_i^T \cdot \vec{\beta}$

- logistic regression: $\pi = P(y = 1 | x) = h(\eta) = \frac{\exp(\eta)}{1 + \exp(\eta)}$

➔ **Fog probability**

- **Verification based on Brier score:** $BS = \frac{1}{N} \sum_{i=1}^N (\pi_i - y_i)^2$
Binary observation
Forecast probability

- **L**east **A**bsolute **S**hrinkage and **S**election **O**perator (Tibshirani (1996))

- Penalized regression

$$\hat{\beta} = \arg \min_{\beta} \left\{ l(\beta) + \lambda \sum_{j=1}^p |\beta_j| \right\}$$

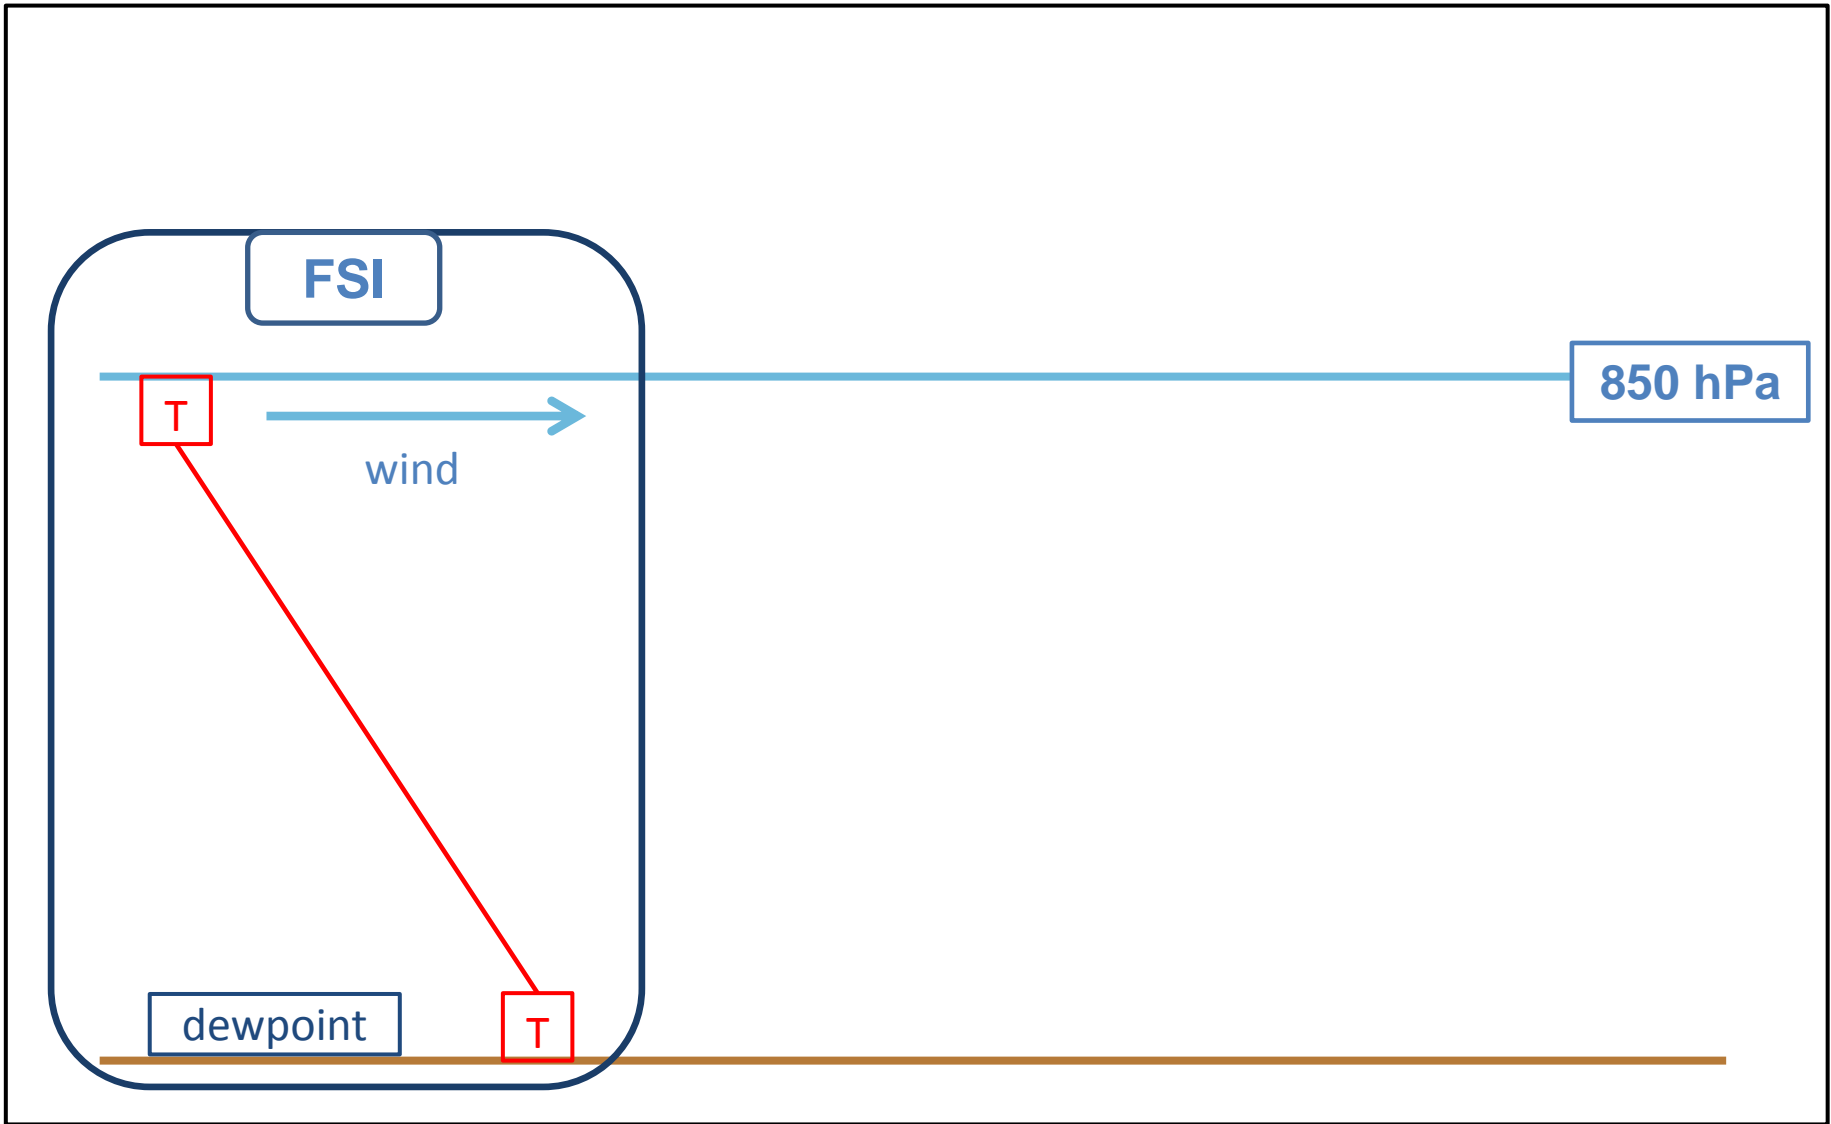

LASSO Penalty

$\lambda > 0$: LASSO-Parameter

- Predictors \rightarrow LASSO \rightarrow select parameters
- Many variables can be tested
- Cross validation

Choice of Predictors

LASSO Paths – November 2011

- (1) Dewpoint spread
- (2) Stability
- (3) Wind 850 hPa
- (4) Wind 10 m
- (9) Theta 5

Cross validation LASSO-GLM

Year 2011

- penalized coefficients from LASSO for each verification period
- influence of parameters on fog formation changes over the year
- sun and interaction with other variables do not have much influence

Reliability diagram – November 2011

FSI (COSMO-DE)

FOGCAST (COSMO-DE)

Reliability diagram – Year 2011

FSI (COSMO-DE)

FOGCAST (COSMO-DE)

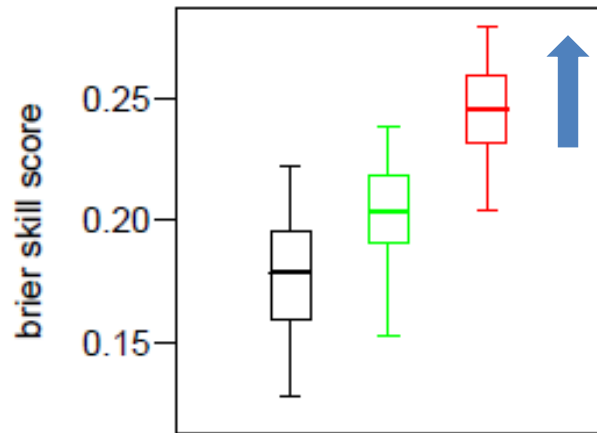

Brier Score

$$BS = \frac{1}{n} \sum_{i=1}^I N_i (y_i - \bar{o}_i)^2 - \frac{1}{n} \sum_{i=1}^I N_i (\bar{o}_i - \bar{o})^2 + \bar{o}(1 - \bar{o})$$

FSI

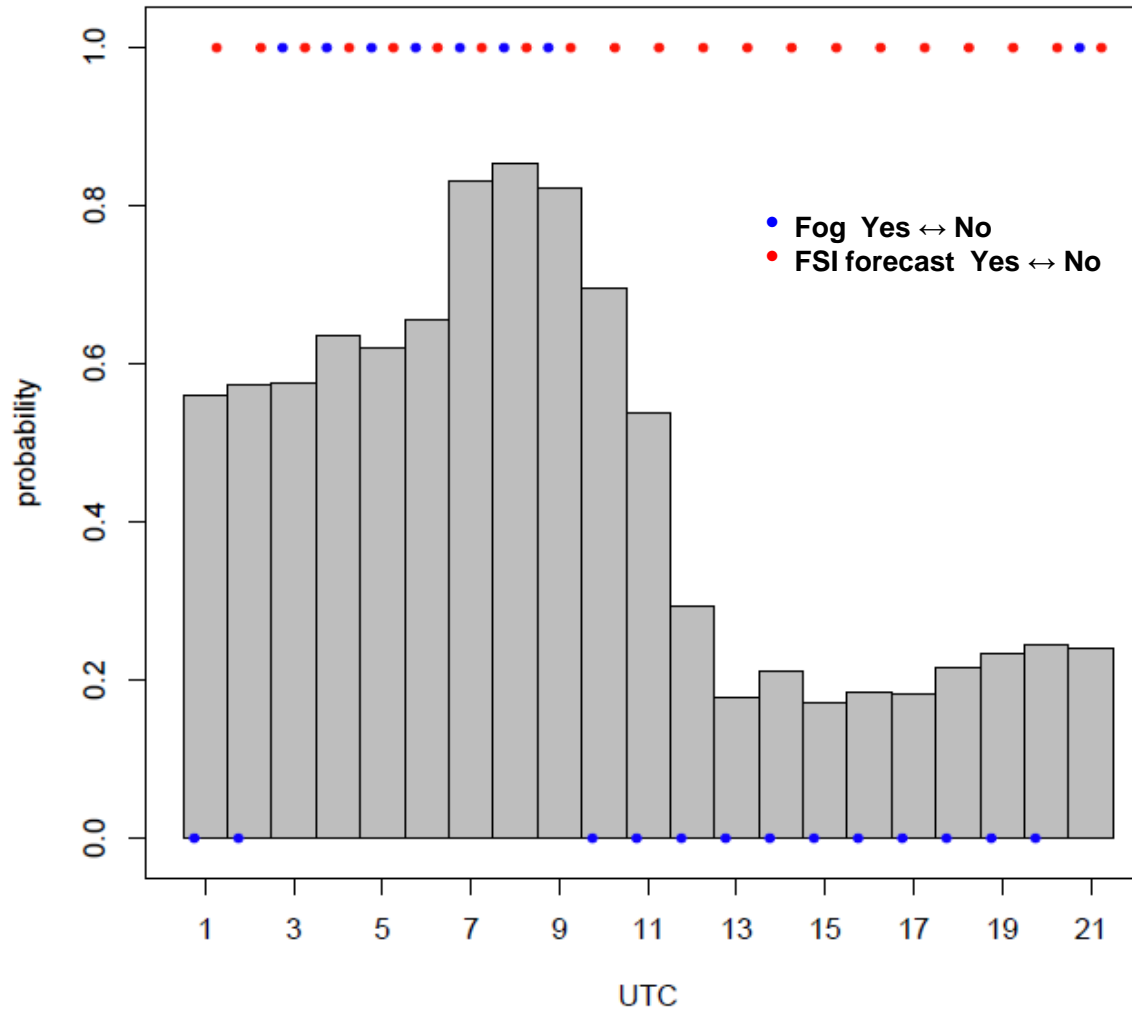

Components of FSI

FOGCAST

Comparison of FSI and FOGCAST

14.11.2011 Munich-City

Conclusions & Outlook

- FOGCAST – a probabilistic fog forecast based on COSMO-DE forecasts
 - Quantification of **forecast uncertainty**
 - The FSI components contain the largest skill (BSS ~20%)
 - With LASSO-GLM: additional covariates show clear improvement of fog forecast (BSS ~25%)
 - FOGCAST as **testbed**
 - Identification of skillful predictors
-
- Next step
 - Test influence of **vertical resolution**
 - Test with different **turbulence scheme** and **microphysics**
